Volumetric Data

DATA SOURCE

- ▶ Computed tomography (CT)
- ▶ Magnetic resonance (MRI)
- ▶ Confocal laser scanning microscopy
- ▶ Ultrasonic imaging
- ▶ Cryo-electron tomography
- ▶ Positron emission tomography (PET)
- ▶ ...

DATA REPRESENTATION

- ▶ Regular, 3-dimensional grid of samples (voxels)
 - ▶ Scalar values – density, absorption coefficients, event counting
 - ▶ Vectors
 - ▶ Color
- ▶ 3D texture:
 - ▶ Trilinear filtering
 - ▶ Easy *slicing* in general direction
- ▶ 2D texture:
 - ▶ Set of textures
 - ▶ Texture atlas
 - ▶ Manual filtering in Z-direction

2D SLICES

Direct Volume Rendering

VOLUME RENDERING INTEGRAL

$$I(D) = I_0 e^{-\int_{s_0}^D \kappa(t) dt} + \int_{s_0}^D q(s) e^{-\int_s^D \kappa(t) dt} ds$$

- ▶ entry point s_0
- ▶ exit point D (camera position)
- ▶ emission at a point q
- ▶ I_0 initial intensity s_0 (light emittance of the background),
- ▶ κ is absorption coefficient.

VIEWPORT ALIGNED SLICES

- ▶ Generate proxy geometry
 - ▶ Viewport aligned slices (billboards)
 - ▶ Limited by volume bounding box – limit fragment count
 - ▶ Convex – easy to triangulate
- ▶ Enable framebuffer blending
 - ▶ Color attachment with float precision

RAY-CASTING

- ▶ Generate rays from camera through each pixel
 - ▶ Fragments generated by rendering bounding volume
- ▶ Discrete samples along the ray
- ▶ Numerical computation of the rendering integral

VOLUME COMPOSITING SCHEMES

- ▶ In Direct Volume Rendering, *compositing* accumulates color and opacity along the viewing ray.
- ▶ Two main compositing orders:
 - ▶ **Front-to-back**: processes samples from the eye toward the volume.
 - ▶ **Back-to-front**: processes samples from deep in the volume toward the eye.

COMPOSITING EQUATIONS

Color premultiplied by alpha

Front-to-Back Compositing:

$$C_{dst} \leftarrow C_{dst} + (1 - \alpha_{dst})C_{src}$$

$$\alpha_{dst} \leftarrow \alpha_{dst} + (1 - \alpha_{dst})\alpha_{src}$$

- Supports *early ray termination* when $\alpha_{dst} \approx 1$.

Back-to-Front Compositing (painter's algorithm):

$$C_{dst} \leftarrow (1 - \alpha_{src})C_{dst} + C_{src}$$

- Doesn't allow early termination.

Opacity from Absorption (based on distance):

$$\alpha_i = 1 - e^{-\kappa_i \Delta s}$$

COLOR BLEEDING

Interpolation with/without premultiplied alpha

MAXIMUM INTENSITY PROJECTION

- ▶ Uses maximum value found along the ray.
- ▶ Bad sense of depth.

MAXIMUM INTENSITY PROJECTION

MAXIMUM INTENSITY PROJECTION

DIRECT VOLUME RENDERING

- ▶ Use values stored in voxels (color, density)
- ▶ Simple contrast/lightness adjustments

COMBINED GEOMETRY RENDERING

- ▶ Opaque geometry
 - ▶ Rendered before volume
 - ▶ Rays terminated by value in z-buffer
- ▶ Transparent geometry
 - ▶ Checking for geometry/ray intersections during ray traversal
 - ▶ Color computed together with volume sampling

Transfer Functions

1D TRANSFER FUNCTIONS

- ▶ Runtime fuzzy classification
- ▶ Transfer function $g(v) : R \rightarrow R^4$
- ▶ Ray sample: $g(f(\mathbf{x}))$
- ▶ Maps scalar value to RGBA color.
- ▶ Implementation:
 - ▶ 1D RGBA texture with interpolation
 - ▶ Final sample color – access TF texture

HISTOGRAM + 1D TF

1D TRANSFER FUNCTIONS

GRADIENT

- ▶ $\nabla f(\mathbf{x}) = \left(\frac{\partial f(\mathbf{x})}{\partial x_1}, \frac{\partial f(\mathbf{x})}{\partial x_2}, \frac{\partial f(\mathbf{x})}{\partial x_3} \right)$
- ▶ Direction of the greatest rate of increase.
- ▶ Magnitude is the slope of the graph.
- ▶ Directional derivative: $\frac{\partial f(\mathbf{x})}{\partial \mathbf{v}} = \nabla f(\mathbf{x}) \cdot \mathbf{v}$
 - ▶ Can be computed on the fly
 - ▶ Symmetric differences

1D TRANSFER FUNCTIONS + LIGHT

- ▶ Better surface shape perception.
- ▶ Compute shading for opaque regions (α channel over some threshold)
- ▶ Normalized gradient as surface normal.

1D TRANSFER FUNCTIONS + LIGHT

1D TRANSFER FUNCTIONS

POST-CLASSIFICATION VS. PRE-CLASSIFICATION

- ▶ Pre-classification
 - ▶ TF applied before rendering
 - ▶ Interpolating already mapped data
- ▶ Post-classification
 - ▶ TF applied on the fly
 - ▶ Mapping interpolated input
- ▶ TF pre-integration
 - ▶ More precise integratal computation
 - ▶ Precompute integrals for each possible segment (start, end values)

2D TRANSFER FUNCTIONS

- ▶ Transfer function $h(v_1, v_2) : R^2 \rightarrow R^4$
- ▶ Ray sample: $h(f(\mathbf{x}), g(\mathbf{x}))$
- ▶ Maps two dimensional vector to RGBA color.
- ▶ Where we get the second dimension?
 - ▶ Dual source CTs
 - ▶ Gradient magnitude ...

GRADIENT MAGNITUDE

- ▶ Can be computed on the fly.
- ▶ Ability to separate borders from homogeneous regions.

GRADIENT MAGNITUDE

SCATTER PLOT

SIZE-BASED TRANSFER FUNCTIONS

SHAPE ORIENTED TRANSFER FUNCTIONS

Improvements

LIGHTING

- ▶ Self shadowing
- ▶ Material modeling
- ▶ Light scattering
- ▶ ...

JITTERING

- ▶ Uniform ray sampling – alias
- ▶ Hide behind noise:
 - ▶ Randomly shift ray origins, along view direction
 - ▶ Pregenerated random texture

SPEEDUP TECHNIQUES

- ▶ Early termination
 - ▶ Do not sample data behind opaque sections
- ▶ Empty space skipping
 - ▶ Large sparse data
 - ▶ Multiresolution
 - ▶ Skip sections without important data
 - ▶ Must be recomputed when TF changes

Isosurfaces

POLYGONAL MESH

- ▶ Polygonal mesh representing level set
- ▶ Volume preprocessing:
 - ▶ Cuberille (+filtering)
 - ▶ Marching cubes, tetrahedra, ...
- ▶ Use normal rasterization pipeline for rendering

REALTIME ISOSURFACE CONSTRUCTION

- ▶ Ray-casting
 - ▶ Search for isovalue crossings
 - ▶ Fine search in subintervals for intersection point
 - ▶ Gradient for surface normal

ISO-SURFACES

ISO-SURFACES

Vector Fields

DATA SOURCE

- Physical simulations:
 - Fluid dynamics
 - Particle simulations
 - Electromagnetic fields (Maxwell)

NUMERICAL INTEGRATION

- ▶ Simulate motion under vector field influence
- ▶ Numerical integration
 - ▶ Euler method – low numerical stability, fast
 - ▶ Higher order Runge-Kutta methods

DIFFERENTIAL OPERATORS

► $\nabla = \frac{\partial}{\partial x} \frac{\partial}{\partial y} \frac{\partial}{\partial z}$

► Gradient

► $\nabla f(\mathbf{x}) = \left(\frac{\partial f(\mathbf{x})}{\partial x_1}, \frac{\partial f(\mathbf{x})}{\partial x_2}, \frac{\partial f(\mathbf{x})}{\partial x_3} \right)$

► Divergence

► $\nabla \cdot \mathbf{F} = \frac{\partial \mathbf{F}_x}{\partial x} + \frac{\partial \mathbf{F}_y}{\partial y} + \frac{\partial \mathbf{F}_z}{\partial z}$

► Curl

► $\nabla \times \mathbf{F} = \left(\frac{\partial \mathbf{F}_z}{\partial y} - \frac{\partial \mathbf{F}_y}{\partial z}, \frac{\partial \mathbf{F}_x}{\partial z} - \frac{\partial \mathbf{F}_z}{\partial x}, \frac{\partial \mathbf{F}_y}{\partial x} - \frac{\partial \mathbf{F}_x}{\partial y} \right)$

GLYPHS, ICONS, PROBES

- ▶ Sample vector field:
 - ▶ Arrows
 - ▶ Lines
 - ▶ Balls, ellipsoids
 - ▶ Ribbons
- ▶ Other characteristics represented by shape, color
- ▶ To prevent clutter:
 - ▶ Importance sampling
 - ▶ Slice-probe through vector field

RENDERING GLYPHS

- ▶ Large number of similar geometries
- ▶ Instanced rendering
 - ▶ Impostors for complicated geometries
- ▶ Geometry shader:
 - ▶ From point samples generate glyph geometry

GLYPH EXAMPLES

► Sampling jitter

► Different shading

LINE INTEGRAL CONVOLUTION

- ▶ Underlying texture blurred along vector directions
 - ▶ Multiple texture accesses in fragment shader – integration

LIC ON SURFACE

- Compute in object fragment shader

Point Clouds

DATA SOURCE

- ▶ Surface points:
 - ▶ 3D scanner output
 - ▶ Scene reconstruction:
 - ▶ Stereo cameras
 - ▶ Camera + depth sensor (Kinect)
 - ▶ Single moving camera
- ▶ Random spatial samples:
 - ▶ Unstructured vector field
 - ▶ Unstructured volume

POINT CLOUD RENDERING

- ▶ Glyph for each point
 - ▶ Colored/textured facets
- ▶ Glyph for group of points
 - ▶ Size, shape – properties of point group

VOLUME RENDERING

- ▶ Unstructured volume samples:
 - ▶ Datastructure for fast queries (octree, ...)
 - ▶ Ray sample – weighted average of points in certain radius
- ▶ Surface reconstruction:
 - ▶ Distance field
 - ▶ Isosurface rendering
